

Foodie Profile HTML Assignment

File: foodie-profile.html | HTML5 boilerplate, lists, image link and table

Name: _____ Roll No.: _____ Date: _____

Note: Put the code from Questions 2 to 5 inside the <body> of the file from Question 1, in order. Replace the sample name, story, dishes and restaurants with your own.

Question 1: HTML5 boilerplate and title

Create a new HTML file called foodie-profile.html with the full HTML5 boilerplate structure (<!DOCTYPE html>, <html>, <head>, <body>) and set the title to 'My Foodie Profile'.

Code

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>My Foodie Profile</title>
</head>
<body>

  <!-- Questions 2 to 5 go here -->

</body>
</html>
```

- <!DOCTYPE html> tells the browser this is an HTML5 page.
- <html> is the root element. <head> holds information about the page, and <body> holds what you see.
- The <title> text, 'My Foodie Profile', appears on the browser tab.

Question 2: Headings and paragraphs

Add headings and paragraphs to introduce yourself as a food lover, including your favourite cuisine and a short story about your best meal.

Code

```
<h1>Hi, I'm Riya, a Food Lover</h1>

<h2>My Favourite Cuisine</h2>
<p>My favourite cuisine is Italian. I love how a simple mix of cheese, tomato
  and herbs can taste so good, and I can eat pasta and pizza any day of
  the week.</p>

<h2>My Best Meal Ever</h2>
<p>My best meal was on my birthday last year. My family took me to a small
  restaurant where the pizza came straight from a wood-fired oven. The crust
  was crispy, the cheese was stretchy, and we ended the night with a warm
  chocolate brownie. I still remember the smell when the pizza arrived at
  our table.</p>
```

Use <h1> once for the main heading and <h2> for the sections. The <p> tags hold the paragraphs.

Question 3: Unordered and ordered lists

Add an unordered list of your top 5 favourite dishes and a numbered list of 3 restaurants you want to try next.

Code

```
<h2>My Top 5 Favourite Dishes</h2>
<ul>
  <li>Margherita Pizza</li>
  <li>Paneer Butter Masala</li>
  <li>Masala Dosa</li>
  <li>Pav Bhaji</li>
  <li>Veg Biryani</li>
</ul>

<h2>Restaurants I Want to Try Next</h2>
<ol>
  <li>Spice Route, Ahmedabad</li>
  <li>Bella Napoli, Vadodara</li>
  <li>Thali House, Rajkot</li>
</ol>
```

`<ul>` makes a bulleted (unordered) list and `<ol>` makes a numbered (ordered) list. Each item goes inside an `<li>` tag. The restaurant names are examples; replace them with places you really want to visit.

Question 4: Clickable image that opens in a new tab

Insert an image of your favourite dish using the `<img>` tag and make it clickable so it opens the official website of that dish or restaurant in a new tab using an anchor (`<a>`) tag. Hint: use `target="_blank"`.

Code

```
<h2>My Favourite Dish</h2>
<a href="https://www.dominos.co.in/" target="_blank" rel="noopener noreferrer">
  
</a>
```

- The `<img>` tag shows the picture. Save your photo as `favourite-dish.jpg` in the same folder as the HTML file, or change `src` to match your file name. The `alt` text describes the picture for screen readers and shows if the image fails to load.
- Wrapping the `<img>` inside an `<a>` tag makes the picture clickable.
- `target="_blank"` opens the link in a new tab.
- `rel="noopener noreferrer"` is a safety addition that stops the new tab from controlling your page.
- Domino's India is used as the example link (`www.dominos.co.in`). Replace it with the official website of your own favourite dish's restaurant.

Question 5: Table comparing food delivery apps

Create a table that compares 3 food delivery apps (e.g. Zomato, Swiggy, Uber Eats) with columns for App Name, Delivery Charges and Rating. Fill in sample data for each.

Code

```
<h2>Food Delivery Apps Compared</h2>
<table border="1" cellpadding="8" cellspacing="0">
  <caption>Sample data for practice</caption>
  <thead>
    <tr>
      <th>App Name</th>
      <th>Delivery Charges</th>
      <th>Rating</th>
    </tr>
  </thead>
  <tbody>
    <tr>
      <td>Zomato</td>
      <td>₹30</td>
      <td>4.3 / 5</td>
    </tr>
    <tr>
      <td>Swiggy</td>
      <td>₹25</td>
      <td>4.4 / 5</td>
    </tr>
    <tr>
      <td>Uber Eats</td>
      <td>₹35</td>
      <td>4.1 / 5</td>
    </tr>
  </tbody>
</table>
```

- `<table>` creates the table. `<tr>` is a row, `<th>` is a heading cell and `<td>` is a normal data cell.
- `<thead>` and `<tbody>` separate the heading row from the data rows.
- `₹` is the code for the rupee sign.
- The charges and ratings are made-up sample data. Uber Eats was suggested in the question, but it no longer operates in India, so you can replace that row with another Indian delivery app if you prefer.

How to view the result

Save the file, then double-click it to open it in your browser. You should see the tab title 'My Foodie Profile', your headings and paragraphs, the two lists, the clickable picture and the table.
