

HTML and Chrome DevTools Assignment

Instagram inspection | myprofile.html | DevTools | DOM structure

Name: _____ Roll No.: _____ Date: _____

Question 1: Inspect an Instagram post image

Open Instagram's home page in Chrome, right-click on a post image, use Inspect Element to find the exact HTML tag and CSS class used for the image container, and write down the tag name and class.

Steps

1. Open instagram.com in Chrome and log in so the feed loads.
2. Right-click on a post's image and choose **Inspect**.
3. The Elements panel opens with a line highlighted. Instagram often places a transparent layer over the image, so the highlighted line may not be the image itself. If so, look a few lines above or below for the `<img>` tag. It has a `src` pointing to an Instagram image server and usually an `alt` description.
4. The container is the `<div>` that wraps that `<img>`. Click it and read its `class` value in the Elements panel.

What to write down

- **Tag name:** `div` for the container (the image itself is an `img` tag).
- **Class:** copy the exact value shown on your screen. Instagram's class names are not readable words. They are long, automatically generated strings such as `x1lllihq x1n2onr6` ..., and they change whenever Instagram updates its site, so the value must be copied from your own inspection.
- The whole post is usually wrapped in an `<article>` tag.

Question 2: myprofile.html

Create a simple HTML file named myprofile.html that displays your name, a short bio and a profile picture using appropriate HTML tags (`h1`, `p`, `img`). Open it in your browser and view the result.

Code (save as myprofile.html)

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <title>My Profile</title>
</head>
<body>
  <div class="profile">
    <h1>Riya Patel</h1>
    
    <p>I am a computer science student from Ahmedabad. I like web design, music and gaming.</p>
  </div>
</body>
</html>
```

How to view it: Save the code in a file named `myprofile.html`, put a picture named `profile.jpg` in the same folder, and double-click the file to open it in your browser. Change the name and bio to your own.

Result: The name appears as a large heading, the picture is below it, and the bio is underneath. If the picture does not show, check that the file name and extension match exactly.

Tags used: `h1` for the name (main heading), `img` for the picture (with `alt` text for accessibility), and `p` for the bio paragraph.

Question 3: Change the name's background colour using DevTools

Use Chrome DevTools to change the background colour of your name live in the browser, without editing the HTML file.

Steps

1. Open `myprofile.html` in Chrome.
2. Right-click your name and choose **Inspect**. The `<h1>` line is highlighted.
3. In the **Styles** pane on the right, click inside the `element.style { }` box at the top and type the line below, then press Enter. The name's background turns yellow immediately.

```
background-color: yellow;
```

Alternative (Console tab):

```
$0.style.backgroundColor = "lightblue"
```

Here `$0` means the element currently selected in the Elements panel.

Why the file is unchanged: DevTools only edits the copy of the page held in the browser's memory. When you refresh the page, the change disappears and the original colour returns. The `myprofile.html` file on your computer is never touched.

Question 4: DOM structure of myprofile.html

Draw a diagram or write a list showing the DOM structure (parent-child relationships) of myprofile.html, with at least 3 levels (html > body > your content).

DOM tree

```
html
|-- head
|   |-- meta (charset="UTF-8")
|   |-- title
|   |-- "My Profile" (text)
|-- body
    |-- div (class="profile")
        |-- h1
        |   |-- "Riya Patel" (text)
        |-- img (src="profile.jpg", alt="...")
        |-- p
            |-- "I am a computer science student..." (text)
```

Parent-child relationships

- `html` is the root. Its children are `head` and `body`.
- `body` has one child, `div`.
- `div` has three children: `h1`, `img` and `p`. These three are siblings of each other.
- `h1` and `p` each have one text node as a child. `img` has no children.
- **Levels:** `html` (level 1) > `body` (level 2) > `div` (level 3) > `h1` / `img` / `p` (level 4) > text (level 5). This is more than the 3 levels required.
