

SQL Assignment — Group 1: Restaurants and Playlists - CREATE ALTER DROP

Group 1 — Restaurants / Playlists: CREATE, ALTER, DROP

1. CREATE TABLE restaurants

Write a `CREATE TABLE` statement to create a table called 'restaurants' with columns: `id` (`INT`, primary key, auto-increment), `name` (`VARCHAR(100)`), `location` (`VARCHAR(100)`), and `rating` (`DECIMAL(2,1)`).

```
CREATE TABLE restaurants (  
  id      INT AUTO_INCREMENT PRIMARY KEY,  
  name    VARCHAR(100),  
  location VARCHAR(100),  
  rating  DECIMAL(2,1)  
);
```

Explanation: `AUTO_INCREMENT` on `id` automatically generates a new, incrementing number for each row so it doesn't need to be provided manually on insert. `DECIMAL(2,1)` stores a number with 2 total digits and 1 after the decimal point (e.g. 4.5), suited for ratings out of 5.

2. ALTER TABLE to add average_cost

Use the `ALTER TABLE` command to add a new column 'average_cost' (`INT`) to your 'restaurants' table.

```
ALTER TABLE restaurants  
ADD COLUMN average_cost INT;
```

Explanation: `ALTER TABLE ... ADD COLUMN` modifies an existing table's structure without deleting its current data. The new `average_cost` column is added with data type `INT` and will default to `NULL` for any rows that already exist.

3. DROP TABLE restaurants

Write a SQL statement to `DROP` the 'restaurants' table you created earlier.

```
-- WARNING: This permanently deletes the table AND all its data. Double-check before running.  
DROP TABLE restaurants;
```

Explanation: `DROP TABLE` removes the table definition and every row it contains — this cannot be undone unless you have a backup. It's good practice to run a `SELECT * FROM restaurants;` first to confirm you're targeting the right table, and to take a backup/export if the data matters, before executing a `DROP`.

4. CREATE TABLE playlists (Spotify-style)

Create a new table called 'playlists' with columns: `playlist_id` (`INT`, primary key, auto-increment), `title` (`VARCHAR(50)`), `created_by` (`VARCHAR(50)`), and `created_at` (`DATE`).

```
CREATE TABLE playlists (  
  playlist_id INT AUTO_INCREMENT PRIMARY KEY,  
  title       VARCHAR(50),  
  created_by  VARCHAR(50),  
  created_at  DATE  
);
```

Explanation: Structured the same way as the restaurants table — `playlist_id` auto-increments as the primary key, while `title` and `created_by` hold short text, and `created_at` stores just a calendar date (no time component) for when the playlist was made.
